

Tab D.

INTERNAL CABLE ROUTING

A review of cable routing before and after the establishment of the present trial organization appears to indicate that the internal information and coordination problem has been increased in that a substantially greater percentage of cables are routed to more than one Section.

Sufficient copies are usually available so that no significant problems exist on the timely dissemination of information. However, if there is a corresponding increase in the required coordination for release of cables, some additional delays will occur.

The routing requirement for approximately 200 cables received in July and another 200 received in November are compared below:

	<u>July</u>	<u>November</u>
Routed to only one Sec.	70.7%	52.5
Routed to two or more Sec.	29.3	47.8
Routed to three " " "	4.4.	18.4
Routed to four " " "	0.0	5.7
Routed to five " " "	0.0	2.1
